

Qualitative Field Insights: Observation Sheet Analysis

Based on an analysis of the field researchers' raw notes from the Obs_Observations sheet, three distinct qualitative themes emerge regarding teacher behavior and program adoption.

1. The "Compliance vs. Engagement" Reality in Digital Learning

WARNING

Observation: Teachers are often clicking through digital courses strictly for compliance without absorbing the material.

Field Evidence:

- *"He just did the course without listening the content, he just share politically right answer."*
- *"He generally starts the course and do some other work... His feedback was to give pdf of question answers."*
- *"The teacher mentioned he does online courses only when he thinks it is important. On probing further... he mentioned that when multiple messages and reminders come and it gets mandated, then he will consider it important."*

Insight: Digital course completion metrics are likely inflated by "click-through" compliance. Teachers view these courses as administrative hurdles mandated by persistent WhatsApp reminders rather than genuine professional development opportunities. Long course durations are the primary driver of this disengagement.

2. Systemic Barriers to Classroom Translation

CAUTION

Observation: Even when in-person training is well-received, translating it to the classroom is blocked by structural realities (student attendance, single-teacher schools, administrative load).

Field Evidence:

- *"उनके अनुसार ट्रेनिंग का 20% ही वो इंप्लीमेंट कर पाते हैं क्योंकि समय की कमी और administrative कार्य ज्यादा साथ ही बच्चों की अनियमित उपस्थिति के कारण भी शिक्षक चीजों को नहीं कर पाते।"* (Implies only 20% implementation due to time, admin work, and irregular student attendance).

- "एकल शिक्षक होने के कारण सीख लागू नहीं होती।"(Being a single-teacher school prevents implementation).
- "She tried sometimes but due to strength of students and management of student, she was not doing it on a regular basis."

Insight: The failure to execute lesson plans is not necessarily a pedagogical failure, but an operational one. Training modules are designed for an idealized classroom. When faced with massive class sizes, multi-grade teaching, or high absenteeism, the prescribed activities become impossible to manage.

3. The Informal Cascade of CLSS Learnings

NOTE

Observation: CLSS knowledge transfer within schools is entirely informal, relying on casual conversations rather than structured meetings.

Field Evidence:

- "शिक्षिका CLSS में प्राप्त सीख को विद्यालय स्तर पर सहकर्मी शिक्षकों के साथ अनौपचारिक चर्चा के माध्यम से साझा करती हैं... विद्यालय स्तर पर सीख के प्रसार (cascade) की कोई औपचारिक या संरचित व्यवस्था नहीं है।"(Learnings are shared through informal chats; there is no formal or structured cascade system).
- "CLSS learning was shared with both regular teachers and guest teachers... Through discussions, teachers exchanged ideas and solutions."
- "ट्रेनिंग के दौरान जो ग्रुप बने थे वो ट्रेनिंग के बाद से इनएक्टिव हो गए।"(WhatsApp groups formed during training became inactive afterward).

Insight: While peer-to-peer learning is happening, it is highly dependent on individual teacher initiative. Without a formalized 10-minute slot in a staff meeting, the cascade of CLSS learnings is inconsistent and evaporates quickly after the training ends.

Strategic Recommendations for Field Operations

1. **Redesign for the "Realistic" Classroom:** Future training materials must include explicit modules on how to execute activities in *challenging* environments (e.g., "How to run this activity with 60 students" or "How to adapt this for a single-teacher school").

2. **Audit Digital Course Formats:** Stop relying on course completion certificates as a metric for learning. If teachers are asking for "just the PDF of answers" to get through the long videos, the videos are too long. Pivot to 3-minute micro-videos.
3. **Formalize the Cascade:** Field teams and Jan Shikshaks (JSKs) must mandate that Headmasters schedule a formal 10-minute "CLSS Debrief" at the weekly school assembly, transitioning the knowledge transfer from casual hallway chats to a structural requirement.

Digital Training: Key Insights & Recommendations

Based on the recent data cohort of 60 teachers regarding digital training, the following thematic insights and actionable recommendations have been synthesized.

1. The Awareness vs. Adoption Paradox

WARNING

Finding: Only **23 out of 60 teachers (38%)** are actively aware of the digital training initiatives, yet platform engagement numbers (DIKSHA, iGOT) indicate that teachers are consuming content when prompted.

- **Insight:** There is a severe communication gap at the top of the funnel. The majority of teachers (62%) are unaware of the overarching digital training program. However, when they *do* receive links, they are highly willing to participate.
- **Information Source:** The primary driver of information is the **WhatsApp group**.
- **Recommendation:** Stop relying on passive dashboards or official portals for announcements. Formalize WhatsApp as the official broadcast channel. Create standardized, easily shareable WhatsApp "Digital Training Posters" with direct 1-click links to the courses.

2. Platform Fragmentation

NOTE

Finding: Platform usage is fragmented: **40** use DIKSHA, **30** use iGOT, and **24** use both platforms interchangeably.

- **Insight:** Teachers are comfortable navigating state/national platforms, but splitting attention across DIKSHA and iGOT dilutes the learning journey and makes tracking difficult. DIKSHA is currently the stronger platform (40 users).

- **Recommendation:** Consolidate the training ecosystem. Drive all primary CM RISE or state-specific courses exclusively through DIKSHA to establish a single source of truth for digital professional development.

3. The "After-Hours" Learning Window

IMPORTANT

Finding: A massive **48 out of 60 teachers (80%)** prefer completing their digital training at home, **after school hours**.

- **Insight:** The assumption that teachers can or will complete digital professional development during school hours is fundamentally flawed. School environments likely lack the time, quiet space, or reliable internet required for focused learning.
- **Duration Preference:** The optimal learning block is **2 hours** (preferred by 18 teachers).
- **Recommendation:** Design courses explicitly for mobile, at-home consumption. Ensure courses can be downloaded while at school (if Wi-Fi is available) for offline viewing at home. Break down modules so they fit comfortably within a 2-hour maximum completion window.

4. Content Preferences: Interactive Over Passive

TIP

Finding: The most liked features of the digital training are **animated videos, assessments, and quizzes**.

- **Insight:** Teachers do not want to read long PDFs or static text modules on their phones after a long day of work. They prefer highly engaging, gamified, and visual content. Quizzes and assessments provide immediate dopamine and a sense of completion.
- **Recommendation:** Shift the content creation budget away from text-heavy Margdarshika documents towards short (3-5 minute) animated scenario videos. Every video should be immediately followed by a short, interactive quiz to validate learning and maintain engagement.

5. Primary Barriers to Entry

CAUTION

Finding: The biggest barriers preventing completion are **technical issues** and **time engagement (workload)**.

- **Insight:** When a teacher sits down at home to do a 2-hour course and encounters a login error or a video that won't buffer, they abandon the course. "Time engagement" indicates that courses stretching beyond their preferred 2-hour window are deemed too burdensome.
- **Recommendation:**
 1. **Tech Support:** Create a dedicated WhatsApp chatbot or technical support hotline specifically for DIKSHA login/playback issues.
 2. **Micro-Learning:** Strictly enforce a 2-hour cap on all digital courses. If a topic requires more time, split it into "Part 1" and "Part 2" to respect the teachers' time constraints.
